Term-Project Presentations and Course Wrap-Up

23 Nov 2026 | Project sharing

ECO 351 – Introduction to Econometrics

Shi Qiu – Fall 2026

Project-sharing discussion

Each presenter will explain a focused economic question, show the evidence, and discuss what the analysis can support.

As listeners, identify the comparison behind the main result. Ask whether the interpretation matches the model and the data.

The submitted project remains the assessment specified in the existing project instructions.

A useful presentation structure

1. State the economic question and define the main outcome and regressor.
2. Explain the data, sample, and model in one clear equation.
3. Show a figure and interpret the main result in its units.
4. Discuss uncertainty and the strongest threat to the interpretation.
5. End with a direct answer and a question for the class.

Use the evidence you actually produced. A statistically insignificant result can still support an informative discussion.

Questions for the audience

Choose one substantive question for each presentation.

- What observations or changes identify the reported coefficient?
- Does the model answer the stated question, with the right units?
- What omitted factor could change the conclusion?
- What would a different functional form or sample help check?

Distinguish a request for clarification from a claim that the analysis is wrong.

Project presentations

Economic question

Data and comparison

Evidence and interpretation

Limitations and discussion

What the projects reveal about applied econometrics

Across the projects, compare how researchers:

- Define a meaningful comparison and choose a model for it.
- Report magnitude and uncertainty without overstating causality.
- Use checks to address specific concerns rather than accumulate output.

What conclusion became clearer after a classmate asked about a model assumption?

Final-exam preparation

Practise explaining the model before calculating an answer. For each problem, identify the target, the comparison, the appropriate calculation, and the interpretation.

Review the existing course practice materials and assessment instructions. The final exam follows the AUS timetable.

Thank you for the work and discussion this semester.
